

Name: TITONG, LEE IVAN B	Date Performed: 08-15-2025
Course/Section: CPE 212-CPE31S2	Date Submitted: 08-15-2025
Instructor: Engr. Robin Valenzuela	Semester and SY: 2025-2026
Activity 2: SSH Key-Based Authentication and Setting up Git	
1. Objectives: <ul style="list-style-type: none"> 1.1 Configure remote and local machine to connect via SSH using a KEY instead of using a password 1.2 Create a public key and private key 1.3 Verify connectivity 1.4 Setup Git Repository using local and remote repositories 1.5 Configure and Run ad hoc commands from local machine to remote servers 	
Part 1: Discussion <p>It is assumed that you are already done with the last Activity (Activity 1: Configure Network using Virtual Machines). <i>Provide screenshots for each task.</i></p> <p>It is also assumed that you have VMs running that you can SSH but requires a password. Our goal is to remotely login through SSH using a key without using a password. In this activity, we create a public and a private key. The private key resides in the local machine while the public key will be pushed to remote machines. Thus, instead of using a password, the local machine can connect automatically using SSH through an authorized key.</p> <p>What is ssh-keygen?</p> <p>Ssh-keygen is a tool for creating new authentication key pairs for SSH. Such key pairs are used for automating logins, single sign-on, and for authenticating hosts.</p> <p>SSH Keys and Public Key Authentication</p> <p>The SSH protocol uses public key cryptography for authenticating hosts and users. The authentication keys, called SSH keys, are created using the keygen program.</p> <p>SSH introduced public key authentication as a more secure alternative to the older .rhosts authentication. It improved security by avoiding the need to have password stored in files and eliminated the possibility of a compromised server stealing the user's password.</p> <p>However, SSH keys are authentication credentials just like passwords. Thus, they must be managed somewhat analogously to usernames and passwords. They should have a proper termination process so that keys are removed when no longer needed.</p>	
Task 1: Create an SSH Key Pair for User Authentication <ul style="list-style-type: none"> 1. The simplest way to generate a key pair is to run <i>ssh-keygen</i> without arguments. In this case, it will prompt for the file in which to store keys. 	

First, the tool asked where to save the file.

SSH keys for user authentication are usually stored in the users `.ssh` directory under the home directory. However, in enterprise environments, the location is often different. The default key file name depends on the algorithm, in this case `id_rsa` when using the default RSA algorithm. It could also be, for example, `id_dsa` or `id_ecdsa`.

```
vboxuser@TitongUbuntuDesktop: ~  
vboxuser@TitongUbuntuDesktop:~/Desktop$ cd ..  
vboxuser@TitongUbuntuDesktop:~$ sudo ssh-keygen  
[sudo] password for vboxuser:  
Generating public/private ed25519 key pair.  
Enter file in which to save the key (/root/.ssh/id_ed25519):  
Enter passphrase (empty for no passphrase):  
Enter same passphrase again:  
Your identification has been saved in /root/.ssh/id_ed25519  
Your public key has been saved in /root/.ssh/id_ed25519.pub  
The key fingerprint is:  
SHA256:jHFPYHSBSfPgBQLYpT/1oU7TAEuGynQWvtX5zdApcxs root@TitongUbuntuDesktop  
The key's randomart image is:  
+--[ED25519 256]--+  
|  oo=*o0+++. |  
|  o.=+ Bo0 . . |  
| o +o + B B E |  
|  o + * 0 0 o |  
|    . + S = + |  
|      + . |  
|      . |  
|-----[SHA256]-----+  
vboxuser@TitongUbuntuDesktop:~$
```

2. Issue the command `ssh-keygen -t rsa -b 4096`. The algorithm is selected using the `-t` option and key size using the `-b` option.

```
vboxuser@TitongUbuntuDesktop: ~
+----[SHA256]-----+
vboxuser@TitongUbuntuDesktop:~$ ssh-keygen -t rsa -b 4096
Generating public/private rsa key pair.

Enter file in which to save the key (/home/vboxuser/.ssh/id_rsa): Enter passphrase
Enter same passphrase again:
Your identification has been saved in /home/vboxuser/.ssh/id_rsa
Your public key has been saved in /home/vboxuser/.ssh/id_rsa.pub
The key fingerprint is:
SHA256:l1P5wDADuVVLE1eiL5QkabkrQoGndAGRoPwwoqXDILg vboxuser@TitongUbuntuDesktop
The key's randomart image is:
+---[RSA 4096]----+
|  +o+Bo..o=+*.o..|
| o ++.o . =0 B . |
|o o . . + .X |
|*+ . . .+ + |
|B. . S +.. o |
| o . .... . |
|E . . |
| |
+----[SHA256]-----+
vboxuser@TitongUbuntuDesktop:~$
```

3. When asked for a passphrase, just press enter. The passphrase is used for encrypting the key, so that it cannot be used even if someone obtains the private key file. The passphrase should be cryptographically strong.
4. Verify that you have created the key by issuing the command `ls -la .ssh`. The command should show the `.ssh` directory containing a pair of keys. For example, `id_rsa.pub` and `id_rsa`.

```
vboxuser@TitongUbuntuDesktop:~$ ls -la .ssh
total 24
drwx----- 2 vboxuser vboxuser 4096 Aug 15 09:09 .
drwxr-x--- 15 vboxuser vboxuser 4096 Aug 15 08:55 ..
-rw----- 1 vboxuser vboxuser  0 Aug  1 09:18 authorized_keys
-rw----- 1 vboxuser vboxuser  419 Aug 15 08:57 id_ed25519
-rw-r--r-- 1 vboxuser vboxuser  110 Aug 15 08:57 id_ed25519.pub
-rw----- 1 vboxuser vboxuser 3401 Aug 15 09:09 id_rsa
-rw-r--r-- 1 vboxuser vboxuser  754 Aug 15 09:09 id_rsa.pub
vboxuser@TitongUbuntuDesktop:~$
```

Task 2: Copying the Public Key to the remote servers

1. To use public key authentication, the public key must be copied to a server and installed in an `authorized_keys` file. This can be conveniently done using the `ssh-copy-id` tool.
2. Issue the command similar to this: `ssh-copy-id -i ~/.ssh/id_rsa user@host`

```
vboxuser@TitongUbuntuDesktop:~$ ssh-copy-id -i ~/.ssh/id_rsa.pub vboxuser@192.168.56.105
/usr/bin/ssh-copy-id: INFO: Source of key(s) to be installed: "/home/vboxuser/.ssh/id_rsa.pub"
The authenticity of host '192.168.56.105 (192.168.56.105)' can't be established.
ED25519 key fingerprint is SHA256:AeG2iNl5y1Msu9i2JjAPdxcSEbDeLJs0cNFogdYr7Ms.
This key is not known by any other names.
Are you sure you want to continue connecting (yes/no/[fingerprint])? yes
/usr/bin/ssh-copy-id: INFO: attempting to log in with the new key(s), to filter out any that are already installed
/usr/bin/ssh-copy-id: INFO: 1 key(s) remain to be installed -- if you are prompted now it is to install the new keys
vboxuser@192.168.56.105's password:

Number of key(s) added: 1

Now try logging into the machine, with: "ssh 'vboxuser@192.168.56.105'"
and check to make sure that only the key(s) you wanted were added.

vboxuser@TitongUbuntuDesktop:~$
```

3. Once the public key has been configured on the server, the server will allow any connecting user that has the private key to log in. During the login process, the client proves possession of the private key by digitally signing the key exchange.
4. On the local machine, verify that you can SSH with Server 1 and Server 2. What did you notice? Did the connection ask for a password? If not, why?

```
vboxuser@TitongUbuntuDesktop:~$ ssh vboxuser@192.168.56.105
Welcome to Ubuntu 24.04 LTS (GNU/Linux 6.14.0-27-generic x86_64)

 * Documentation:  https://help.ubuntu.com
 * Management:    https://landscape.canonical.com
 * Support:       https://ubuntu.com/pro

Expanded Security Maintenance for Applications is not enabled.

307 updates can be applied immediately.
1 of these updates is a standard security update.
To see these additional updates run: apt list --upgradable

Enable ESM Apps to receive additional future security updates.
See https://ubuntu.com/esm or run: sudo pro status

1 updates could not be installed automatically. For more details,
see /var/log/unattended-upgrades/unattended-upgrades.log
vboxuser@TitongUbuntuDesktop:~$
```

Reflections:

Answer the following:

1. How will you describe the ssh-program? What does it do?

SSH (Secure Shell) is a protocol designed to establish secure connections to remote computers over a network. It ensures encrypted communication and allows for safe command execution, file transfers, and remote management.

2. How do you know that you already installed the public key to the remote servers?

If you can connect to the remote servers via SSH without being prompted for a password, it indicates that the public key has been correctly added to the appropriate file on those remote machines.

Part 2: Discussion

Provide screenshots for each task.

It is assumed that you are done with the last activity (**Activity 2: SSH Key-Based Authentication**).

Set up Git

At the heart of GitHub is an open-source version control system (VCS) called Git. Git is responsible for everything GitHub-related that happens locally on your computer. To use Git on the command line, you'll need to download, install, and configure Git on your computer. You can also install GitHub CLI to use GitHub from the command line. If you don't need to work with files locally, GitHub lets you complete many Git-related actions directly in the browser, including:

- Creating a repository
- Forking a repository
- Managing files
- Being social

Task 3: Set up the Git Repository

1. On the local machine, verify the version of your git using the command *which git*. If a directory of git is displayed, then you don't need to install git. Otherwise, to install git, use the following command: *sudo apt install git*

```
vboxuser@TitongUbuntuDesktop:~$ sudo apt install git
[sudo] password for vboxuser:
Reading package lists... Done
Building dependency tree... Done
Reading state information... Done
The following additional packages will be installed:
  git-man liberror-perl
Suggested packages:
  git-daemon-run | git-daemon-sysvinit git-doc git-email git-gui gitk gitweb
  git-cvs git-mediawiki git-svn
The following NEW packages will be installed:
  git git-man liberror-perl
0 upgraded, 3 newly installed, 0 to remove and 306 not upgraded.
Need to get 4,806 kB of archives.
After this operation, 24.5 MB of additional disk space will be used.
Do you want to continue? [Y/n] Y
Get:1 http://ph.archive.ubuntu.com/ubuntu noble/main amd64 liberror-perl all 0.17029-2 [25.6 kB]
Get:2 http://ph.archive.ubuntu.com/ubuntu noble-updates/main amd64 git-man all 1:2.43.0-1ubuntu7.3 [1,100 kB]
Get:3 http://ph.archive.ubuntu.com/ubuntu noble-updates/main amd64 git amd64 1:2.43.0-1ubuntu7.3 [3,680 kB]
```

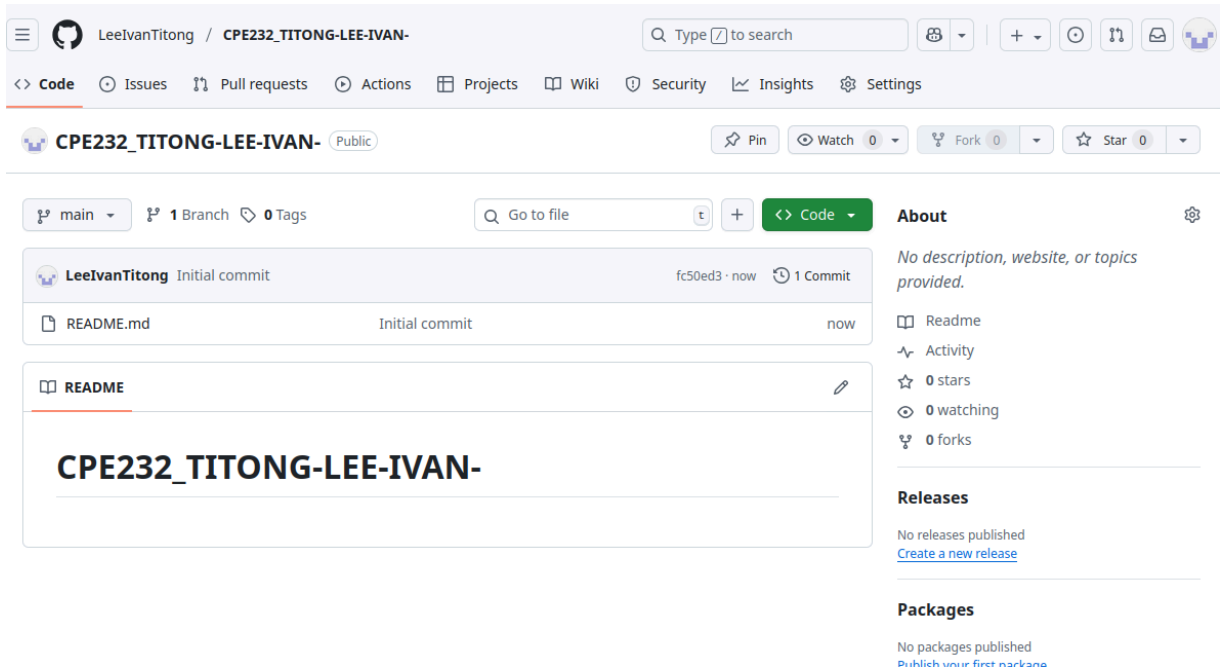

2. After the installation, issue the command *which git* again. The directory of git is usually installed in this location: *user/bin/git*.

```
vboxuser@TitongUbuntuDesktop: ~
Get:1 http://ph.archive.ubuntu.com/ubuntu noble/main amd64 liberror-perl all 0.17029-2 [25.6 kB]
Get:2 http://ph.archive.ubuntu.com/ubuntu noble-updates/main amd64 git-man all 1:2.43.0-1ubuntu7.3 [1,100 kB]

vboxuser@TitongUbuntuDesktop:~$ which git
/usr/bin/git
vboxuser@TitongUbuntuDesktop:~$
```

3. The version of git installed in your device is the latest. Try issuing the command `git --version` to know the version installed.

```
vboxuser@TitongUbuntuDesktop:~$ git --version
git version 2.43.0
vboxuser@TitongUbuntuDesktop:~$
```

4. Using the browser in the local machine, go to www.github.com.
5. Sign up in case you don't have an account yet. Otherwise, login to your GitHub account.
- a. Create a new repository and name it as CPE232_yourname. Check Add a README file and click Create repository.

- b. Create a new SSH key on GitHub. Go your profile's setting and click SSH and GPG keys. If there is an existing key, make sure to delete it. To create a new SSH keys, click New SSH Key. Write CPE232 key as the title of the key.

```

d. Clone the repository that you created. In doing this, you need to get the link from GitHub. Browse to your repository as shown below. Click on the Code drop down menu. Select SSH and copy the link.

- e. Issue the command `git clone` followed by the copied link. For example, `git clone git@github.com:jvtaylar-cpe/CPE232_yourname.git`. When prompted to continue connecting, type yes and press enter.

```
vboxuser@TitongUbuntuDesktop:~$ git clone git@github.com:LeeIvanTitong/CPE232_TITONG-LEE-IVAN-.git
Cloning into 'CPE232_TITONG-LEE-IVAN-'...
The authenticity of host 'github.com (4.237.22.38)' can't be established.
ED25519 key fingerprint is SHA256:+DiY3wvV6TuJJhbpZisF/zLDA0zPMSvHdkr4UvCOqU.
This key is not known by any other names.
Are you sure you want to continue connecting (yes/no/[fingerprint])? yes
Warning: Permanently added 'github.com' (ED25519) to the list of known hosts.
remote: Enumerating objects: 3, done.

remote: Total 3 (delta 0), reused 0 (delta 0), pack-reused 0 (from 0)
Receiving objects: 100% (3/3), done.
```

- f. To verify that you have cloned the GitHub repository, issue the command `ls`. Observe that you have the CPE232_yourname in the list of your directories. Use `CD` command to go to that directory and `LS` command to see the file README.md.

```
vboxuser@TitongUbuntuDesktop:~$ ls
CPE232_TITONG-LEE-IVAN-  Documents  Music      Public  Templates
Desktop                  Downloads  Pictures   snap    Videos
vboxuser@TitongUbuntuDesktop:~$
```

- g. Use the following commands to personalize your git.

- `git config --global user.name "Your Name"`
- `git config --global user.email yourname@email.com`
- Verify that you have personalized the config file using the command `cat ~/.gitconfig`

```
vboxuser@TitongUbuntuDesktop: ~/CPE232_TITONG-LEE-IVAN-
vboxuser@TitongUbuntuDesktop:~/CPE232_TITONG-LEE-IVAN-$ git config --global user
.name "Lee Ivan Titong"
vboxuser@TitongUbuntuDesktop:~/CPE232_TITONG-LEE-IVAN-$ git config --global user
.email "qlibtitong@tip.edu.ph"
vboxuser@TitongUbuntuDesktop:~/CPE232_TITONG-LEE-IVAN-$ cat ~/.gitconfig
[user]
    name = Lee Ivan Titong
    email = qlibtitong@tip.edu.ph
vboxuser@TitongUbuntuDesktop:~/CPE232_TITONG-LEE-IVAN-$
```

- h. Edit the README.md file using nano command. Provide any information on the markdown file pertaining to the repository you created. Make sure to write out or save the file and exit.

```
vboxuser@TitongUbuntuDesktop: ~/CPE232_TITONG-LEE-IVAN-
GNU nano 7.2                                README.md
## CPE232_TITONG-LEE-IVAN-

[ Read 1 line ]

^X Exit    ^R Read File  ^_ Replace   ^U Paste     ^J Justify   ^_ Go To Line
```

- i. Use the `git status` command to display the state of the working directory and the staging area. This command shows which changes have been staged, which haven't, and which files aren't being tracked by Git. Status output does not show any information regarding the committed project history. What is the result of issuing this command?

```
vboxuser@TitongUbuntuDesktop:~/CPE232_TITONG-LEE-IVAN-$ git status
On branch main
Your branch is up to date with 'origin/main'.

Changes not staged for commit:
  (use "git add <file>..." to update what will be committed)
  (use "git restore <file>..." to discard changes in working directory)
        modified:   README.md

no changes added to commit (use "git add" and/or "git commit -a")
vboxuser@TitongUbuntuDesktop:~/CPE232_TITONG-LEE-IVAN-$
```

- j. Use the command *git add README.md* to add the file into the staging area. git

```
vboxuser@TitongUbuntuDesktop:~/CPE232_TITONG-LEE-IVAN-$ git add README.md
vboxuser@TitongUbuntuDesktop:~/CPE232_TITONG-LEE-IVAN-$ git status
On branch main
Your branch is up to date with 'origin/main'.

Changes to be committed:
  (use "git restore --staged <file>..." to unstage)
        modified:   README.md

vboxuser@TitongUbuntuDesktop:~/CPE232_TITONG-LEE-IVAN-$
```

- k. Use the *git commit -m "your message"* to create a snapshot of the staged changes along the timeline of the Git projects history. The use of this command is required to select the changes that will be staged for the next commit.

```
vboxuser@TitongUbuntuDesktop:~/CPE232_TITONG-LEE-IVAN-$ git commit -m "Hello World 2027"
> 
On branch main
Your branch is ahead of 'origin/main' by 1 commit.
  (use "git push" to publish your local commits)

nothing to commit, working tree clean
vboxuser@TitongUbuntuDesktop:~/CPE232_TITONG-LEE-IVAN-$
```

- l. Use the command *git push <remote><branch>* to upload the local repository content to GitHub repository. Pushing means to transfer commits from the local repository to the remote repository. As an example, you may issue *git push origin main*.

```

vboxuser@TitongUbuntuDesktop:~/CPE232_TITONG-LEE-IVAN-$ git push origin main

Enumerating objects: 5, done.
Counting objects: 100% (5/5), done.
Writing objects: 100% (3/3), 279 bytes | 279.00 KiB/s, done.

To github.com:LeeIvanTitong/CPE232_TITONG-LEE-IVAN-.git
   fc50ed3..739949f  main -> main
vboxuser@TitongUbuntuDesktop:~/CPE232_TITONG-LEE-IVAN-$
vboxuser@TitongUbuntuDesktop:~/CPE232_TITONG-LEE-IVAN-$ git push origin main
Everything up-to-date
vboxuser@TitongUbuntuDesktop:~/CPE232_TITONG-LEE-IVAN-$

```

- m. On the GitHub repository, verify that the changes have been made to README.md by refreshing the page. Describe the README.md file. You can notice the how long was the last commit. It should be some minutes ago and the message you typed on the git commit command should be there. Also, the README.md file should have been edited according to the text you wrote.

The screenshot shows the GitHub interface for the repository 'CPE232_TITONG-LEE-IVAN-'. The repository is public and has 0 stars, 0 forks, and 0 watchers. The README.md file is displayed, showing the title 'CPE232_TITONG-LEE-IVAN-'. The commit history shows a single commit by 'Lee Ivan Titong' with the message 'Hello World 2027' and a timestamp of '1 minute ago'. The repository also has a 'Code' button and a 'Go to file' search bar.

Reflections:

Answer the following:

3. What sort of things have we so far done to the remote servers using ansible commands?

We used Ansible to do tasks on remote servers like:

- Setting up the network.
- Copying SSH keys to allow login without a password.
- Running commands on the servers from our computer.
- Installing software.
- Managing files.

Ansible helps us do these tasks faster and without doing them manually on each server.

4. How important is the inventory file?

The inventory file is very important because it tells Ansible which servers to connect to. It lists all the remote computers and groups them. Without it, Ansible wouldn't know where to run the commands.

Conclusions/Learnings:

In this activity, I learned how to set up SSH key-based authentication to connect to remote servers without using passwords. This makes logging in faster and more secure. I also learned how to configure Git, create a repository, and push changes to GitHub. Using tools like Ansible helps automate tasks on many servers at once, saving time and effort. The inventory file is important because it tells Ansible which servers to manage.
